

# SCS 3208 - Software Project Management

## Topic 4 Risk Management

1

2

## Intended Learning Outcomes

- At the end of this topic, you'll be able to;
  - **Identify** potential risks in software projects
  - **Categorize** and **prioritize** risks
  - **Quantify** the likely effect of risks
  - **Decide** on the risk **actions**
  - **Make plans** to deal with risks

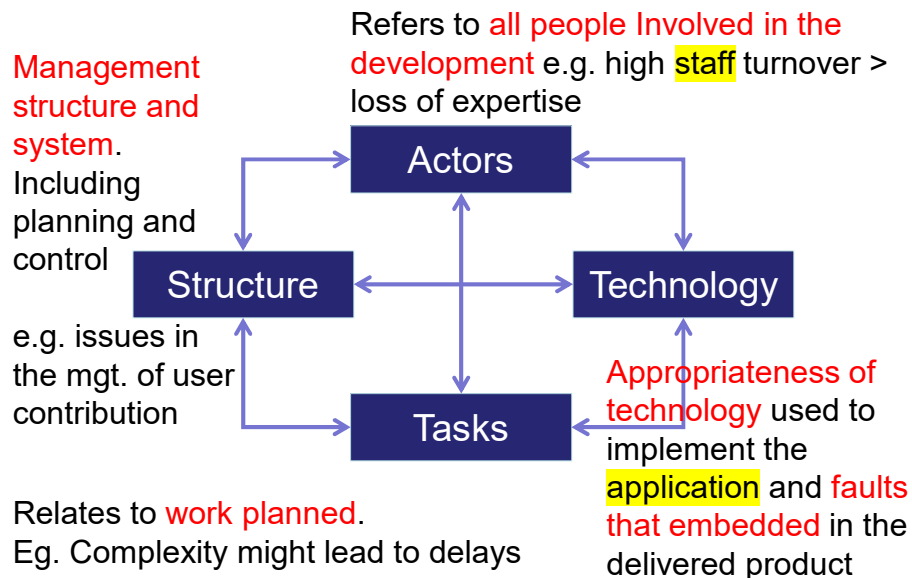

3

## What is a risk?

- An uncertain event or condition that has an effect on the project objectives.
- An unforeseen event that can cause a negative or positive impact on the project's cost, schedule, or quality.
- **Relates to the future**
- **Measured in terms of probability of occurrence** (high-low) **and consequences** (loss: high-low)
- **Involves cause and effect**
- **Risk Categories**
  - Known/Predictable/Unpredictable

4

## Categorizing Risk

5

## Risk Management (RM)

- An attempt to minimize the chances of failure caused by unplanned events/risks.
- Aim to identify, quantify and take actions to minimize the effect of risks on the project
- Risk management involves additional cost
  - RM is cost effective only if the cost of RM is considerably less than the loss incurred
- It's not easy to measure the value of RM.
- Involves two key components:
  - **risk assessment and**
  - **risk control**

6

## A framework for dealing with risks

1. Risk identification
2. Risk estimation (analysis and prioritization)
3. Risk planning
4. Risk monitoring
5. Risk resolution

8

## Risk Identification

- Two main approaches;
  1. Checklist
    - Lists a set of risks that have been found more likely to occur and
    - Suggests countermeasures for each risk
  2. Brainstorming
    - Representatives of the main stakeholders discuss and identify the problems that might occur

9

## Risk Assessment

|                         |                    |                     | Likelihood |          |          |        |         |
|-------------------------|--------------------|---------------------|------------|----------|----------|--------|---------|
| Qualitative Descriptors |                    |                     | Rare       | Unlikely | Possible | Likely | Certain |
|                         |                    | Quantitative Scales | < 0.0001   | 0.001    | 0.01     | 0.1    | 1       |
| Consequence             | Very High Severity | 50,000,000          |            |          |          |        |         |
|                         | High Severity      | 5,000,000           |            |          |          |        |         |
|                         | Medium Severity    | 500,000             |            |          |          |        |         |
|                         | Low Severity       | 50,000              |            |          |          |        |         |
|                         | Very Low Severity  | < 5000              |            |          |          |        |         |

10

## Risk Assessment

- Risk Exposure: **Expected Value** of the loss for the risk

$$\text{Risk Exposure} = \text{Risk Likelihood} \times \text{Risk Impact}$$

$$RE(R) = Prob(R) \times Loss(R)$$

- Risk Likelihood: The probability of a risk.
- Risk Impact: The total loss incurred if the risk happens.

11

## Risk Assessment Contd....

- E.g.

A project depends on a data center which is vulnerable to fire. It is estimated that there is a 1 in 1000 chance fire actually happening. If a fire occurred a new computer configuration could be established for Rs.500,000. Find the risk exposure.

$$RE = Rs.500,000 \times 1/1000 = Rs.500$$

This is the minimum sum an insurance company would require as a premium.

12

## Calculating Risk Exposure

| Factor   | P    | C       | RE             |
|--|------|---------|----------------|
| Late delivery from COTS vendor ACME  | 0.25 | 28 days | 7 days         |
| ACME API integration delay   | 0.6  | 15 days | 9 days         |
| Additional unit testing needed; 3% more classes than first estimated   | 0.9  | 20 days | 18 days        |
| Beta test group reports that they may not be able to fit us into their pipeline until May 1 instead of April 1 | 0.5  | 30 days | 15 days        |
| <b>TOTAL RISK EXPOSURE</b>   |      |         | <b>49 days</b> |

13

## Qualitative Method of Risk Estimation

| Probability | Range                                |
|-------------|--------------------------------------|
| High        | Greater than 50% chance of happening |
| Significant | 30-50% chance of happening           |
| Moderate    | 10-29% chance of happening           |
| Low         | Less than 10% chance of happening    |

*Qualitative descriptors of risk probability and associated range values*

| Impact Level | Range                                  |
|--------------|--|
| High         | More than 30% above budget expenditure |
| Significant  | 20-29% above budget expenditure        |
| Moderate     | 10-19% above budget expenditure        |
| Low          | Within 10 % of budget expenditure      |

*Qualitative descriptors of impact on cost and associated range values*

14

## A probability impact matrix

Tolerance line  
↓

|        |             |             |          |             |      |
|--------|-------------|-------------|----------|-------------|------|
| Impact | High        |             | R6       |             | R1   |
|        | Significant |             | R2, R5   | R3          |      |
|        | Moderate    |             |          |             | R4   |
|        | Low         |             |          |             |      |
|        |             | Low         | Moderate | Significant | High |
|        |             | Probability |          |             |      |

15

## Risk Planning

### How to deal with risks?

- **Risk Acceptance (Tolerate)**
  - Approval of operations under exposure to the risk, according to the organizations policies and criteria for risk acceptance
  - Should also involve provision for recovery under business continuity management
- **Risk Avoidance (Terminate)**
  - Changing of re-engineering the business process
  - Terminate the activity giving rise to risk

17

## Risk Planning ...contd.

- **Risk Reduction (Treat)**
  - Application of security controls
  - Treat risk with appropriate control measures and mechanisms
- **Risk Transfer**
  - Transfer the risk to another party
  - Insurance or outsourcing

18

## A framework for dealing with risks

1. Risk identification
2. Risk estimation (analysis and prioritization)
3. Risk planning
- 4. Risk monitoring and resolution**

19

## Maintaining the Risk Register

| RISK RECORD                 |                 |        |                 |         |
|-----------------------------|-----------------|--------|-----------------|---------|
| Risk id                     | Risk title      |        |                 |         |
| Owner                       | Date raised     |        | Status          |         |
| Risk description            |                 |        |                 |         |
| Impact description          |                 |        |                 |         |
| Recommended risk mitigation |                 |        |                 |         |
| Probability/impact values   |                 |        |                 |         |
|                             | Probability     | Impact |                 |         |
|                             |                 | Cost   | Duration        | Quality |
| Pre-mitigation              |                 |        |                 |         |
| Post-mitigation             |                 |        |                 |         |
| Incident/action history     |                 |        |                 |         |
| Date                        | Incident/action | Actor  | Outcome/comment |         |
|                             |                 |        |                 |         |

- Refer to the project plan and record the most threatening risks in a risk register.
- After starting the project, all emerging risks need to be added.
- Review and amend the register at regular intervals.
- Close the entry once the relevant risky activities are completed.

20

## Deciding Risk Reduction Action

- Risks that cannot be avoided or reduced immediately can have more than one countermeasure.
  - Consider Cost vs. Benefits
- Risk Reduction Leverage (RRL)- measures the ROI or the risk reduction technique

$$\text{RRL} = \frac{\text{RE before} - \text{RE after}}{\text{Risk Reduction Cost}}$$

21

## Example: Use of RRL

$$\text{RRL} = \frac{2500 - 150}{40000} = 0.059$$

| Risk               | Probability of occurring | Total loss if it occurs | Risk Exposure |  |
|--------------------|--------------------------|-------------------------|---------------|--|
| Competitive strike | 10%                      | 25K                     | 2500          |  |

| Countermeasure       | Total cost | New risk probability | New total loss | New RE | RRL   |
|----------------------|------------|----------------------|----------------|--------|-------|
| Advertising campaign | 40K        | 3%                   | 5K             | 150    | 0.059 |
| Price promotions     | 30K        | 5%                   | 10K            | 500    | 0.067 |
| Simultaneous launch  | 10K        | 8%                   | 15K            | 1200   | 0.13  |

Highest RRL indicates most cost-effective countermeasure

22

## Activity

•ABA association needs to find the total risk exposure to their project. The following table lists two major risks that ABA has identified, the probability of each risk, and the estimated delay each can cause. Complete the following table by calculating the total risk exposure.

| Risk Factor  | Probability | Delay (Days) | Risk Exposure |
|--|-------------|--------------|---------------|
| 1. Delay in purchasing required software to develop the media elements | 0.8         | 45           |               |
| 2. Video recording delay   | 0.5         | 15           |               |
| Total risk exposure  |             |              |               |

23

The following table lists some countermeasures identified to reduce the impact of the risks described in question 3(b). Suppose that the organization has to spend Rs 1000 per delayed date. Calculate the Risk Reduction Leverage of each solution and complete the following table.

|    | Countermeasures  | Cost (Rs.) | New Risk Probability | New total delay | New Risk Exposure (days) | Risk Reduction Leverage |
|----|--|------------|----------------------|-----------------|--------------------------|-------------------------|
| 1. | A. Start the procurement process early by spending the deposits. | 10,000     | 0.6                  | 30 days         |                          |                         |
|    | B. Obtain software from software-as-a service                    | 50,000     | 0.7                  | 35 days         |                          |                         |
| 2. | C. Hire expert cameraman   | 75,000     | 0.3                  | 7 days          |                          |                         |
|    | D. Recruit another cameraman                                     | 50,000     | 0.4                  | 10 days         |                          |                         |

24

## Evaluate the effects of uncertainty

- Techniques to **take account of the uncertainties** in the duration of activities within a project
  - PERT (Program/Project Evaluation Review Technique)
  - Monte Carlo /Probability simulation
  - Critical Chain Management

25

## Using PERT

- Most likely time (m)
- Optimistic time (a)
- Pessimistic time (b)
- (Single) Expected time ( $t_e$ )

$$t_e = (a + 4m + b)/6$$

- Activity Standard Deviation (s)

$$s = (b - a)/6$$

$s \propto (b-a)$  is used to rank the measure of degree of uncertainty or risk of activity

26

## Exercise 1

| Activity | a (wk) | m (wk) | b (wk) | $t_e$ (wk) | s (wk) |
|----------|--------|--------|--------|------------|--------|
| A        | 5      | 6      | 8      | 6.17       | 0.50   |
| B        | 3      | 4      | 5      | 4          | 0.33   |
| C        | 2      | 3      | 3      | 2.83       | 0.17   |
| D        | 3.5    | 4      | 5      | 4.08       | 0.25   |
| E        | 1      | 3      | 4      | 2.83       | 0.50   |
| F        | 8      | 10     | 15     | 10.5       | 1.16   |
| G        | 2      | 3      | 4      | 3          | 0.33   |
| H        | 2      | 2      | 2.5    | 2.08       | 0.08   |

27

## Calculating expected duration

- Use the same method as in the CPM technique
- Carry out forward pass through a network
- Calculated event dates are the dates by which we expect to achieve those events

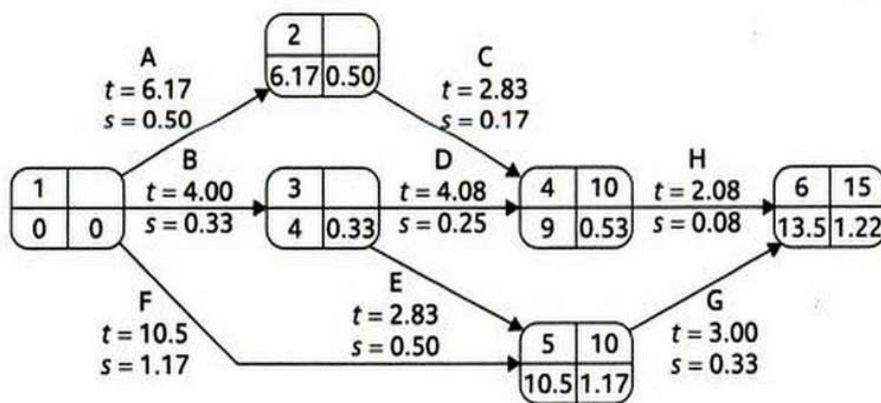

29

## Finding Standard Deviation for each project event

- Use forward pass method
- The standard deviation of the first event is always 0
- When there are 2 SDs to be considered in a path, then  $SD = \sqrt{SD1^2 + SD2^2}$
- If an event has only one path (depends only on one activity), the standard deviation of the event is the same as the standard deviation of the activity.
- If there is more than one path, calculate the SD for each path and select the highest SD.

30

## Completed PERT Network

31

## Probability of meeting/missing targets

- The entire project as well as events may have target dates. Also, certain tasks may have to be completed by a target date
- Three step method** of calculating the probability of meeting/missing the target.
  1. Calculate the standard deviation for each event
  2. Calculate the z value for each event having a Target Date
  3. Convert the z values into probabilities

33

## Calculating z value

- Calculated for each node that has a target date
- Equivalent to the number of standard deviations between node's expected and target dates

|    |   |
|----|---|
| EN | T |
| Te | S |

$$z = (T_{\text{target}} - T_{\text{expected}}) / S$$

e.g., Z value for event 6 is;  
 $Z = (15 - 13.5) / 1.22 = 1.23$

|      |      |
|------|------|
| 6    | 15   |
| 13.5 | 1.22 |

34

## Convert z value into probability

35

## Exercise 2

- Calculate the z values for each of the events 4 and 5 and find the probability of missing the target dates.

|   |      |
|---|------|
| 4 | 10   |
| 9 | 0.53 |

|      |      |
|------|------|
| 5    | 10   |
| 10.5 | 1.17 |

36

### Exercise 3

(a) Calculate the  $T_e$  and S (b) Draw the PERT chart (c) Explain the possibility of meeting the following target dates.

Target Dates: Project completion: 46, Event 5: 30 & Event 6: 38

| Activity | Dependency | $T_a$ | $T_m$ | $T_b$ | $T_e$ | S |
|----------|------------|-------|-------|-------|-------|---|
| A        | -          | 8     | 10    | 12    |       |   |
| B        | A          | 5     | 7     | 9     |       |   |
| C        | A          | 1     | 2     | 3     |       |   |
| D        | B          | 6     | 8     | 10    |       |   |
| E        | C, D       | 2     | 3     | 5     |       |   |
| F        | -          | 11    | 13    | 17    |       |   |
| G        | E, F       | 4     | 6     | 8     |       |   |
| H        | G          | 9     | 11    | 14    |       |   |

38

### Exercise 4

- Describe the pros and cons of using PERT technique to identify project risks.

40
